METABOLISM | CELL METABOLISM

A hormone of many talents

Fibroblast growth factor 21 (FGF21) is a hormone that is primarily produced in the liver, as well as in adipocytes and some other tissues. It has been reported to have a variety of beneficial metabolic effects, but there has been no clear mechanistic explanation for ...

AGING | CELL

Human stem cells delay aging in monkeys

A likely cause of loss of vitality in aging is the reduced restorative capacity of stem cells. Lei *et al.* examined the potential of transplanted human mesenchymal progenitor cells (MPCs) to slow aging. The authors transplanted human MPCs into aged macaque monkeys. ...

POLITICAL SCIENCE | AMERICAN JOURNAL OF POLITICAL SCIENCE

Decreasing trust by increasing connectivity

Expanded connectivity across sub-Saharan Africa has contributed to reduced trust in political institutions. Yeandle used data on the gradual expansion of mobile phone service, together with geocoded survey data and focus group discussions, to show how increased connectivity enabled greater communication between people in rural ...

BIOENGINEERING | ACS SYNTHETIC BIOLOGY

Microbes to monitor ocean chemistry

Synthetic biology systems enable researchers to endow organisms with new ways of sensing and responding to stimuli. Extending previous efforts on engineered biofilms, Nevot *et al.* combined an extracellular fibrillar protein with a protein adhesive to create a long-lasting and environmentally robust secreted protein matrix ...

PIGMENTATION | CURRENT BIOLOGY

Sharing pet pictures for science

It has long been known that the orange coloration in tortoiseshell and calico cats is due to an X chromosome inactivation. However, the gene responsible for this trait has been difficult to identify. Two recent studies independently found a single deletion in the intron of ...

CLIMATE CHANGE | PROCEEDINGS OF THE NATIONAL ACADEMY OF SCIENCES

We could have known

At what point in the past could we have detected the anthropogenic influence on climate that now is so glaringly evident had we had good enough instrumentation? Santer *et al.* conducted the thought experiment by assuming that the necessary tools to monitor global-scale atmospheric temperatures ...

NEUROSCIENCE | PROCEEDINGS OF THE NATIONAL ACADEMY OF SCIENCES

Looking away to pay attention

In covert attention studies, subjects often make small eye movements known as microsaccades toward and away from the attended stimulus despite instructions to focus on a central spot. Srinivasan *et al.* analyzed neuronal responses in monkey areas V4, IT, and pulvinar during a covert attention ...
